

# Cardioversion AF - Summary Clinical Guideline

Reference no.: CG-CARDIO/2023/007

Anteroposterior Paddle position reported to have high success rate with lower energy.

For patients with AF undergoing elective electrical cardioversion, the use of biphasic energy of at least 200 J as initial energy can be beneficial to improve success of initial electrical shock.

In patients with obesity and AF, use of manual pressure augmentation and/or further escalation of electrical energy may be beneficial to improve success of electrical cardioversion.

**The biphasic defibrillator MUST be set on a Synchronised setting (sync)**

## Considerations for Anticoagulation in Non-Valvular AF
