

Patient Information

All pregnant women in the UK over the age of 18 have now been offered COVID-19 vaccination

This information is a direct reflection of the merged information sheet and decision aid that was updated on the 20th of July 2021.

Vaccination is recommended in pregnancy, but the decision whether to have the vaccine is your choice. The information below will help you make an informed choice about whether to get the COVID-19 vaccine if you are pregnant or trying to get pregnant.

Your options:

Get a COVID-19 vaccine

or

Wait for more information
about the vaccine in pregnancy

What are the benefits of the vaccination?

✓ COVID-19 may be more dangerous in pregnancy

Studies have shown that hospital admission and severe illness are more common in pregnant women (compared to those not pregnant), especially those in the third trimester of pregnancy, and that stillbirth and preterm birth is more likely (compared to pregnant women without COVID-19). Pregnant women with underlying medical conditions are at higher risk of severe illness.

✓ Vaccination is effective in preventing COVID-19 infection

✓ You cannot get COVID-19 from vaccination

- COVID-19 vaccines do NOT contain live coronavirus
- Vaccines do NOT contain any additional ingredients that are harmful to pregnant women or their babies
- Other non-live vaccines (whooping cough, influenza) are considered safe for pregnant women and their unborn babies

What are the risks of the vaccination?

✗ The COVID-19 vaccines have not yet been tested specifically in pregnant women

- COVID-19 vaccines have been given to large numbers of people to ensure they meet stringent standards of effectiveness and safety
- Data from the United States, where more than 130,000 pregnant women have had a COVID-19 vaccine (using Pfizer BioNtech or Moderna vaccines), has not raised any safety concerns. 4,000 women in Scotland have received a COVID-19 vaccine with no adverse effects recorded
- Future studies in pregnancy will give us more information on how effective the vaccine is in pregnancy, and on pregnancy outcomes after vaccination. There have not been any signals to suggest safety concerns so far

✗ Side effects from the vaccine are common. These do not affect pregnancy, but may include:

- Injection site reactions (sore arm)
- Fatigue
- Headache
- Muscle pain
- Fever, chills
- Joint pain

✗ Extremely rare but serious side effects involving thrombosis (blood clots) have been reported for the AstraZeneca vaccine, but this does not seem to be more likely in pregnant than in non-pregnant people. The Pfizer BioNTech or Moderna vaccines should be offered to pregnant women where available as most of the safety monitoring data from the United States relates to these two vaccines

? You may want to discuss COVID-19 vaccination in more detail with your doctor or midwife

If you decide to have a COVID-19 vaccine, please tell the vaccination team that you are pregnant so that this can be recorded

How to decide: COVID-19 vaccination advice for women who are, or may be pregnant

This leaflet is designed to help you make an informed choice about whether to have the COVID-19 vaccine in pregnancy. At present, the COVID-19 vaccine has been offered to all pregnant women over the age of 18. We know that vaccines are effective in preventing COVID-19. Some pregnant women may become seriously unwell with COVID-19 infection, particularly in the later stages of pregnancy. There is emerging data on the safety of COVID-19 vaccines in pregnancy, and no evidence that the vaccines can cause harm to you or your baby.

What should I do to help me decide?

- Make sure you know as much as you can about the vaccine and the risks of COVID-19 in pregnancy. You can ask your midwife, doctor or an immunisation nurse
- Look up the information on the [NHS](#), [Public Health England \(PHE\)](#) or [professional](#) websites. Available evidence on the safety of vaccines in pregnancy is published by [UKTIS](#), part of PHE
- Look at the information below and think about your risk of catching and becoming seriously unwell from COVID-19. Are you able to reduce your chance of being exposed to COVID-19?

What is known about COVID-19 in pregnancy?

About two-thirds of women who test positive for COVID-19 in pregnancy have no symptoms at all. In the UK, surveillance shows that approximately one in 100 pregnant women who have been admitted to hospital test positive for COVID-19 (although this will change during stages of the pandemic). One in 10 women admitted to hospital with COVID-19 require intensive care. No pregnant women who have received both doses of vaccine have been admitted to hospital since the vaccination programme began. Most of those admitted recently have been unvaccinated, with only five women admitted who had received a single vaccine dose.

In the later stages of pregnancy women are at increased risk of becoming seriously unwell with COVID-19. If you have COVID-19 in pregnancy, you are twice as likely to have a stillbirth, and it is twice as likely that your baby will be born prematurely, which can affect their long-term health.

What is known about the effects of COVID-19 vaccination in pregnant women?

Data from the United States, where over 130,000 pregnant women have had a COVID-19 vaccine, has not raised any safety concerns. The large trials which showed that these vaccines are safe and effective did not include pregnant women – as often happens in clinical trials. This means there is limited information about the effects of COVID-19 vaccination in pregnant women.

COVID-19 vaccines do not contain ingredients that are known to be harmful to pregnant women or to a developing baby. Studies of the vaccines in animals to look at the effects on pregnancy have shown no evidence that the vaccine causes harm to the pregnancy or fertility. The COVID-19 vaccines that we are using in the UK are not 'live' vaccines and so cannot cause COVID-19 infection in you or your baby.

Pregnant women should be offered the Pfizer BioNTech or Moderna vaccines, as most of the safety monitoring data from the United States relates to these two vaccines.

The Government has advised that individuals under the age of 40 should be offered an alternative vaccine to the AstraZeneca vaccine, based on the risk/benefit ratio for that age group.

Does it matter what stage of pregnancy I am in?

The vaccine is considered to be safe and effective at any stage of pregnancy. Some women may choose to delay their vaccine until after the first 12 weeks (which are most important for the baby's development) and will plan to have the first dose at any time from 13 weeks onwards, but there's not evidence that delaying is necessary.

One dose of COVID-19 vaccination gives you good protection against infection, but with the most recent (Delta) variant of the virus, two doses are needed to give a good level of immunity. Second doses are given 8-12 weeks after the first dose and it is recommended you receive two doses before giving birth or before you enter the trimester, when the risk is greatest.

Will having the COVID-19 vaccination affect my work?

No vaccine is 100% effective, but studies suggest that it will help prevent some (but not necessarily all) transmission. So, having a vaccine will not change your occupational risk assessment.

This includes advice that you should not work in high-risk areas if you have another serious medical condition, or if you are beyond 28 weeks' gestation. You will still need to follow the advice in your workplace and at home:

- Practice social distancing
- Wear a face mask as necessary
- Wash your hands carefully and frequently

The information below will help you to think about your decision to have the vaccine if you are pregnant and are eligible for the vaccination

You are at higher risk of catching COVID-19 if:

- Y you or someone in your household is a health or social care worker or works in a care home
- Y your community has a high or increasing rate of COVID infections
- Y you have frequent contact with people outside your home
- Y you are not able to comply with social distancing for the rest of your pregnancy
- Y you live in a crowded household
- Y you are of Black or Asian ethnicity, or from another minority ethnicity background

You are at higher risk of becoming unwell with COVID-19 if:

- Y you have underlying medical conditions such as immune problems, diabetes, high blood pressure, heart disease or asthma
- Y you are overweight
- Y you are over the age of 35
- Y you are in your third trimester of pregnancy (over 28 weeks)

What are the recommendations:

- ✓ COVID-19 vaccines are recommended in pregnancy. Vaccination is the best way to protect against the known risk of COVID-19 in pregnancy for both women and babies
- ✓ Vaccination is recommended to all pregnant women but especially if you are at higher risk of becoming seriously unwell if you do catch COVID-19
- ✓ You may wish to discuss the risks and benefits of vaccination, including possible side-effects, with a healthcare professional before making your final decision. If you choose to have a vaccine, then your healthcare professional will help to facilitate this choice. However, as for the non-pregnant population, you can receive a COVID-19 vaccination even if you haven't had a discussion with a healthcare professional.
