### **1. Introduction**

RhD negative pregnant women carrying a RhD positive fetus are at risk of iso-immunisation which can lead to haemolytic disease of the fetus and newborn. To help prevent this sensitization, women who are RhD negative are recommended to be given Routine Antenatal Anti-D Prophylaxis (RAADP) at 28 weeks gestation and to receive further doses of Anti-D soon after Potentially Sensitizing Events (PSEs), including delivery of the baby. Haematological tests are performed after each PSE at more than 20 weeks gestation to determine the appropriate dose of anti-D. Currently all women whose blood tests show they are RhD negative are given an injection of anti-D immunoglobulin to reduce the risk of potential iso-immunisation.

However, around 40% of RhD negative women will be carrying a fetus that is also RhD negative, meaning that almost half of all the anti-D administered in the antenatal period is unnecessary.

A non-invasive pre-natal test (NIPT) was developed in the 1980s, whereby cell free fetal DNA (cffDNA) which circulates in the maternal circulation could be extracted from a maternal peripheral blood sample. This cell free fetal DNA can then be sequenced to determine if the fetus is RhD negative or RhD positive. This test has originally been undertaken manually and as such was expensive and only used to determine the RhD status of a fetus when maternal anti-D was present. Since 2015, a more automated service has been routinely offered by the International Blood Group Reference Laboratory (IBGRL) which allows all RhD negative pregnant women to be tested to determine the RhD status of the fetus and permit more

individualised management.

The test has been shown to be accurate from 11<sup>+2</sup>/40 gestation, ideally performed at 16/40 gestation, and should be offered to all RhD negative women if there are no anti-D or anti-G maternal red cell antibodies. If either or both of these red cell antibodies are present, the woman should be referred to the fetal medicine department and the diagnostic test should still be carried out. The diagnostic test looks at more sites on the RhD gene, meaning that D variant genes can be identified, and reports can then be tailored to give recommendations for treating the fetus in that pregnancy as RhD positive or RhD negative.

## 2. **Purpose and Outcomes**

- Those women who are carrying a RhD neg baby could avoid unnecessary treatment with anti-D immunoglobulin which is a blood product, and may not need testing following potentially sensitising events or at delivery.
- Those women who are carrying an RhD positive baby can make an informed choice about whether to have treatment with anti-D immunoglobulin. This may lead to better compliance with anti-D immunoglobulin treatment as they will be aware that they are at risk of sensitisation.
- This guideline describes the process to follow for women who choose to access this testing.
- The guideline applies to all women who have been found to be RhD negative on their routine blood group and antibody screen early in pregnancy (<26 weeks) and who are wishing to access UHDB Maternity Services.

## 3. **Key Responsibilities and Duties**

- The Blood Bank laboratory staff will identify those pregnant women who are RhD neg and will add a comment to the report alerting midwives to give the option of non-invasive fetal RhD testing or anti-D prophylaxis.
- Midwives have the responsibility to ensure that woman have the chance to discuss non-invasive fetal RhD testing at an antenatal appointment following the initial booking appointment.
- All clinicians have the responsibility to review the woman's blood group in labour and to be aware of the implications of the fetal RhD status.

## 4. **Abbreviations**

|           |   |  |
|-----------|---|--|
| Anti-D Ig | - | Anti D immunoglobulin                          |
| cffDNA    | - | cell free fetal DNA                            |
| EDD       | - | Estimated Date of Delivery                     |
| IBGRL     | - | International Blood Group Reference Laboratory |
| LIMS      | - | Laboratory Information Management System       |
| MHHR      | - | Maternity Hand Held Record                     |
| NIPT      | - | Non-invasive pre-natal test                    |

Suitable for printing to guide individual patient management but not for storage Review Due: Feb 2025

|       |   |                                      |
|-------|---|--------------------------------------|
| PSE   | - | Potentially Sensitising Event        |
| RAADP | - | Routine Antenatal Anti-D Prophylaxis |

## 5. Proposed schedule for the management of RhD negative pregnant women

See flowchart for detail (appendix 1)

- All women have booking bloods taken at time of booking
- 16/40 visit with midwife – identify RhD negative women booked at the below Hospitals offering fetal RhD screening and offer non-invasive fetal RhD test.
  - If offer accepted then take pink topped EDTA bottle (6mls)
  - Complete IBGRL request form, obtained from Blood Bank (appendix 2)
    - full patient identifiers on sample and form
    - Full name of hospital: Royal Derby Hospital/Queens Hospital  
Burton/Nottingham QMC/NUH/Kingsmill/Birmingham: Heartlands/Good Hope.
    - Unique 5 figure NHSBT code:  
Royal Derby: RTGFG  
Burton: RJF02  
Queens Medical Centre/Nottingham City Hospital: RX1RA  
Kingsmill: RK5BC
    - Chesterfield Hospital will be taking this test on women living in Derbyshire area at 20 weeks. Good Hope and Heartlands Hospitals will also be taking this test on women living in the Staffordshire area at 16 weeks. Contact [dhft.pathantenatal@nhs.net](mailto:dhft.pathantenatal@nhs.net) to request the result and patients result to be added to Lorenzo.
    - Stoke/Walsall and Leicester are not yet offering this test so do not offer this test and treat the patient as carrying a RhD positive fetus
    - Estimated date of delivery (EDD) needs to be confirmed by scan
    - All samples to be sent to RDH or Burton irrespective of which Hospital patient booked to deliver at.
- **SAMPLE MUST NOT TO BE REFRIDGERATED**
- **Cannot** be offered to women who already have immune anti-D or anti-G
- **Cannot** be offered to women who have a positive antibody screen at booking caused by the remains of anti-D Ig prophylaxis
- **Can** be offered to RhD negative women carrying multiple pregnancy
- Rejected samples: offer one repeat only

- Result is reported via Specialist –ICE which is accessed by Blood Bank. Result will then be entered on to the Laboratory Information Management System (LIMS) and transferred to the hospital electronic reporting system (Lorenzo at Derby, Meditech at Burton and the NHSBT IBGRL report attached.
- Results will be added onto the hospital electronic reporting system irrespective of which hospital the patient has booked to deliver at. This result should be recorded within the MHHR
- The report will include the EDD of the pregnancy as well as the predicted fetal RhD genotype
- RAADP offered to RhD negative women who have an inconclusive result or are predicted to be carrying a RhD positive fetus
- RhD negative women who experience a sensitising event to seek medical advice from their booked delivery unit and only have a Kleihauer and Anti-D Ig administered if the fetus is predicted to be Rh positive
- **Late bookers:**
  - If booking >25 weeks gestation but <26+0 weeks, then take an extra 6ml pink topped EDTA sample and if found to be RhD negative then discuss/send for non-invasive fetal RhD testing
  - If booking beyond 26+0 weeks then offer RAADP if RhD negative
- **At delivery:**
  - midwife to take **cord blood** from RhD negative women when fetal blood group is predicted to be RhD negative
  - midwife to take **cord and maternal blood** from RhD negative women when fetal blood group is predicted to be RhD positive or inconclusive
  - midwife to take **cord and maternal blood** from RhD negative women when fetal group is unknown

## 6. **Monitoring Compliance and Effectiveness**

As per agreed business unit audit forward programme
